

The RCS Rupture Disc is a reverse acting, cross-scored rupture disc. It is a non-reclosing differential pressure relief device that provides instantaneous full opening for protection of equipment, vessels and systems from overpressure conditions.

This rupture disc from Continental Disc Corporation is available in a wide variety of materials and in newly expanded nominal sizes ranging from 1" through 32" (25 mm - 800 mm).

Along with its companion insert holder, the RCS Rupture Disc provides reliable pressure relief protection, easy installation, and built in features to help assure correct rupture disc orientation. It is designed to retrofit into your pre-existing assembly or piping arrangements (1" - 8" only).

RCS Rupture Disc Features Include:

- Operating ratio up to 90% of stamped burst rating for pressures greater than 40 psig
- Manufacturing range of zero, -5%, or -10% of specified rating
- Non-fragmenting design
- Safety ratio of 1.5 or less of the stamped rating when free vented, if the rupture disc is damaged during installation
- Inversion ratio of 1.5 or less of the stamped rating, if the rupture disc is burst in tension direction (1" - 8" only)
- Withstands full vacuum without the need for an additional vacuum support component
- Conformance to national and international codes including ASME Section III or VIII, DIN, BSI, JIS, ISO, or other codes when specified
- Excellent cycling and/or pulsating service capabilities
- Good for gas service
- Excellent for isolating pressure relief valves because of its non-fragmenting design
- Available with Continental Disc Corporation's B.D.I.[®] (Burst Disc Indicator) Alarm System
- Optional TEFLON^{®*} liner and protective cover for additional corrosion barriers
- Built-in features:
 1. Three round pins in holder inlet match holes in rupture disc to help assure correct orientation in the holder during assembly (1" - 8" only)
 2. Flow Direction arrows permanently attached to the holder inlet and outlet indicate correct flow direction
 3. 3-D tag attached to the rupture disc provides visual verification of proper rupture disc orientation in relation to process flow
 4. A J-Hook provides easy alignment and proper orientation relative to flow direction. The J-Hook is a standard feature on RCS Holders up to 12" in size
 5. Factory installed Precision Controlled Indentation to control the reversal action for RCS Rupture Discs 10" or above

Manufacturing Range

As a standard, the RCS Rupture Disc is designed with a zero manufacturing range. This enables the disc to operate up to 90% of the customer's specified rating for pressures greater than 40 psig. For systems not required to operate to 90% of the specified burst pressure, other ranges are available upon request. Available ranges include: -2.5 psig or -5 psig for burst pressure ratings below 50 psig and -5% or -10% for burst pressures 50 psig and above.

For rated burst pressures below 40 psig, the recommended operating pressure is 90% of the value of the rated (stamped) burst pressure minus the burst tolerance. (i.e., [stamped rating minus the 2 psig burst tolerance] x .90.)

Burst Tolerance

The RCS Rupture Disc is designed with a burst tolerance of ± 2 psig for pressures under 40 psig, and $\pm 5\%$ for pressures 40 psig and above. The rated burst pressure, appearing on the rupture disc tag, is established as follows:

- For zero manufacturing range rupture discs, a minimum of two burst tests per lot of rupture discs are conducted to determine conformance with the customer's specified burst pressure. The rated (stamped) burst pressure appearing on the tag will be the customer's specified burst pressure. The burst tolerance of $\pm 5\%$ applies to the rated (stamped) burst pressure.
- For rupture discs with -5%, -10%, -2.5 psig, or -5 psig manufacturing ranges, the rated (stamped) burst pressure is established by bursting a minimum of two discs per lot and averaging the actual burst results. This average burst pressure is the rated (stamped) burst pressure which will appear on the rupture disc tag. The burst tolerance of $\pm 5\%$ applies to the rated (stamped) burst pressure.

Recommended Maximum Temperatures

Generally, the burst pressure of a rupture disc will decrease as operating temperatures increase. Table II states the maximum temperatures for commonly used rupture disc materials and linings.

Vacuum

The RCS Rupture Disc is designed to withstand full vacuum without affecting the burst pressure setting or reliability. No additional components, such as a vacuum support, are required.

Corrosion Protection

The RCS Rupture Disc is superior for use in a corrosive media environment. Versatile material selection and use of thicker materials contribute to the outstanding corrosive resistance. The cross-scoring pattern is placed on the outlet side of the rupture disc, to prevent process buildup or corrosion along the score lines. A TEFLON liner may be used on the process side of the RCS Rupture Disc for additional corrosion protection. A TEFLON protective cover is also available to protect the downstream side of the rupture disc.

Optimum Flow

The RCS Rupture Disc's score pattern provides a clean, consistent opening. When an overpressure situation initiates disc reversal, the rupture disc opens in a non-fragmenting, four petal design (see photo above), resulting in an optimum flow condition.

Code Compliance

Continental Disc Corporation will provide rupture discs to national or international code requirements when specified by the customer.

C.D.C. will manufacture, temperature test, and mark rupture discs in compliance with the requested code. Product may be supplied to ASME Section III or VIII, DIN, BSI, JIS, or other codes as required.

Continental Disc Corporation has been accredited and is authorized by the ASME Code to utilize the (UD) Code Symbol Stamp for product built in accordance with the requirements of the ASME Boiler and Pressure Vessel Code, Section VIII, Division 1.

The RCS Rupture Disc flow performance was certified by The National Board of Boiler and Pressure Vessel Inspectors. These certified flow resistance factors (K_R) and minimum net flow area values are available from Continental Disc Corporation or The National Board of Boiler and Pressure Vessel Inspectors.

Continental Disc Corporation maintains an ASME accepted flow laboratory to conduct flow testing for rupture discs, relief valves, and rupture disc/valve combinations.

RCS RUPTURE DISC

RCS Holder (1" - 8" Sizes)

The RCS Holder for sizes 1" - 8" is an *insert* type designed for simplicity and safety of installation with superior sealing capabilities. Alignment of the RCS Rupture Disc and flow direction orientation are achieved with three round pins located in the holder inlet, matching holes in the rupture disc and 3-D tag. Uniform sealing load on the rupture disc is accomplished by using a tapered seat configuration providing a positive metal-to-metal seal between the rupture disc and holder.

This tapered seat is less susceptible to seat damage due to handling or re-installation compared to "bite type" seat designs with pretorque screws. *Pretorque screws, special tools, or sockets are not necessary when using the RCS Holder. The alignment pins provide positive rupture disc orientation utilizing normal pre-assembly side clips and flange bolting.*

As an option, the RCS Holder inlet for sizes 1" - 8" can be supplied with an O-ring of either VITON® or Buna-N material. See Table III for temperature limits of O-ring materials. Contact the factory for complete details.

Additionally the RCS Holder is designed to retrofit into pre-existing piping arrangements without modification. Holders are available for ANSI, JIS, or DIN class flanges and in standard materials of Carbon Steel, 316SS, Monel, or Hastelloy C. Other flange classes or materials can be furnished upon request.

RCS Holder (10" - 32" Sizes)

The RCS Holder for sizes 10" and above is an *insert* type designed for simplicity and safety of installation with superior sealing capabilities. Uniform sealing load on the rupture disc is accomplished by using a tapered seat configuration, providing a positive metal-to-metal seal between the rupture disc and holder.

This tapered seat is less susceptible to seat damage due to handling or re-installation compared to "bite type" seat designs with pre-torque screws.

Holders are available for ANSI, JIS, or DIN class flanges and in standard materials of Carbon Steel, 316SS, Monel, or Hastelloy C. Other flange classes or materials can be furnished upon request.

Pre-assembly screws, instead of side clips, will be used on RCS Holders 10" or above.

B.D.I.® Alarm System

Where immediate notification of pressure relief is required, Continental's B.D.I. (Burst Disc Indicator) Alarm System should be used. Designed for use with Continental's rupture discs, the B.D.I. Alarm automatically notifies the operator, via audio and/or visual warnings, that a rupture disc has burst.

The heart of the system is the B.D.I. Alarm Strip, which is attached to a flat TEFLON membrane and assembled between non-asbestos gaskets. It is installed above the RCS Rupture Disc between the outlet side of the holder and the pipe flange.

When the rupture disc bursts, the strip is broken, disrupting the electrical current through the strip and activating the alarm monitor. The B.D.I. Alarm Strip is resistant to most corrosives and can operate at temperatures ranging from

-40°F (-40°C) to 400°F (206°C). It is available with intrinsically safe monitors and is computer compatible. For more information, refer to C.D.C. Bulletin #5-7701-5.
